Thermotoga neapolitana strain DSM 5068

/*tag= a

Location/Qualifiers

thermostable enzyme; ss.

DNA polymerase; Tne; DNA sequencing; amplification;

The DNA polymerase C-terminal region DNA.

15-AUG-1996 (first entry)

AAT30049;

AAT30049 standard; DNA; 694 BP.

It was obta from a genomic DNA expression library by screening E. coli transformants for thermostable DNA polymerase activity. When the sequence is translated it does not produce the entire amino acid sequence of The polymerase due to frameshift errors generated during sequencing. However, an amino acid sequence was obta, by translating all 3 reading frames (AAW13862-64), comparing these with known sequences, and splicing the The sequence together to form the sequence given in AAW13863. A complete coding sequence for The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence more than 500 bases; reduce false stops in the sequence ladder; reduce template requirements 10-fold (when using 355 labeling); and also requirements for primer and labeled terminator. They increase sequencing efficiency with structure-containing or GC-rich templates; reduce film
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  methods, also for DNA labeling and for synthesis of cDNA from mRNA templates. (I) have higher thermostability than known enzymes (e.g. 50% retention of activity after 60 min at 90 plusoC), and may be free of exonuclease activity and/or ability to discriminate against dideoxynucleotides (ddNTP). They permit sequencing at high temperature, provide strong, clear sequences (increased signal-to-noise ratio); can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel methods for sequencing DNA, amplifying double-stranded DNA or synthesizing DNA which use a mutant Thermotoga neapolitana DNA polymerase (I) or its fragments. (I) are used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             exposure times; do not generate sequencing artefacts with homopolymeric sequences and allow quantitation of bases in heterologous mixtures. This sequence encodes the Thermotoga neapolitana The polymerase carboxyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of Thermotoga neapolitana polymerase with reduced exonuclease activity or reduced discrimination against dideoxynucleotides

The deletion mutant lacks the N-terminal 283 amino acids from the 5' exonuclease domain of the native enzyme and also has amino acid residues 309-424 of the 3' exonuclease domain deleted. The DNA construct was obtd by restriction digestion of pw284-derived DNA (see also AAT58135), when expressed in E. coli, "The M884 delB showed no detectable polymerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31-MAY-1996;

The M323 has an artificially created methionine at amino acid position 323 as the initiator methionine in the 3' exonuclease domain of the enzyme. When expressed in E. coli, The M323 showed
                  Thermostable DNA polymerase from Thermotoga neapolitana - useful in DNA sequencing or for amplification of double stranded DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the DNA polymerase (see also AAWI1513) of Thermotoga neapolitana. The M316 has an artificially created methionize at amino acid position 316 as the initiator methionine. It was created by introducing a Met residue at position 316 (and a corresponding NCOI site) via site-directed mutagenesis of the native The gene (see also AATS8134). When expressed in E. coli from a T7 or tro
                    A DNA sequence (AAT58135) in plasmid pM284 codes for modified DNA polymerase The M284 (AAW11514) in which amino acids 1-283 of the native Thermotoga neapoiltana enzyme (see also AAW11513) are deleted and the naturally occurring Met-284 residue becomes the initiating methionine. It was obtd. by restriction digestion of the native gene (AAT58134). The deleteion results in elimination of 5' exonuclease activity. Further modification of the DNA in pM284
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1276 CTTTCTGTGAGACTTGGAATACCGGTTAAAGAA 1308

                                               A DNA sequence (AAT58136) codes for mutant thermostable DNA polymerase The M284(D323B) (AAW1515) in which amino acids 1-283 of the native Thermotoga neapolitana enzyme (see also AAW1513) are deleted and amino acid residue 323 (Asp) of native The is substd. by Glu. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and used for prodn. of The M284(D323E) in transformed host cells. The mutant enzyme has no significant 5' or 3' exonuclease activity and
e.g. PCR.

                           e.g. PCR
                                      ANY58135). The mutated geno can be incorporated into a vector and used for prodn. of The M284(B232b) in transformed host cells. The mutant enzyme has no significant 5' or 3' exonuclease activity and is suitable for use in DNA sequencing and amplification reactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Percent Similarity:
                                                                                                                                                                                                                                                                        A DNA sequence (AAT58138) codes for mutant thermostable DNA polymerase Tne M284(Y464F) (AAW11517) in which amino acids 1-283 of the native Thermotoga neapolitana enzyme (see also AAW11513) are deleted and amino acid residue 464 (Tyr) of native Tne is substd. by Phe. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and AAT581351.
                                                                                                          Sequence 1833 BP;
                                                                                                                                                                    sequencing and amplification reactions, e.g. PCR.
                                                                                                                                                                                            used for prodn. of The M284(Y464F) in transformed host cells mutant enzyme has no significant 5' exonuclease activity and reduced 3' exonuclease activity. It is suitable for use in DNA

٦,

Thermostable DNA polymerase from Thermotoga neapolitana - ${\tt DNA}$ sequencing or for amplification of double stranded DNA useful

Claim 20; Page 161-163; 200pp; English.

The M284(D323E) (AAW11520) in which amino acids 1-283 of the native Thermotoga meapolitana enzyme (see also AAW11513) are deleted and amino acid residue 389 (Asp) of native The is substd. by Ala. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and used for prodn. of The M284(D389A) in transformed host cells. The amplification reactions, e.g. mutant enzyme is suitable for use in DNA sequencing and A DNA sequence (AAT58141) codes for mutant thermostable DNA polymerase

                                                                                                                                        A DNA sequence (AAT58142) codes for mutant thermostable DNA polymerase Tne M284(D323E,D389A) (AAM1521) in which amino acids 1-283 of the native Thermotoga neapolitana enzyme (see also AAM1513) are deleted and amino acid residue 323 (Asp) of native Tne is substd. by Ala, and Asp-389 by Ala. It was obtd. by site-directed mutagenesis of pM284 DNA (see also AAT58135). The mutated gene can be incorporated into a vector and used for prodn. of the triple mutant in transformed host cells. The triple mutant has no significant 5' or 3' exonuclease activity and a half-life at 97.5 deg C of 22 min compared with 5 min for native Tne and 8 min for native Taq. It is suitable for use in DNA sequencing and amplification reactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31-MAY-1996;

                                                  mease in the 3' exonuclease domain of the enzyme. It was obtd.] site-directed mutagenesis of DNA (AATS8142) coding for a triple mutant. The mutated gene can be incorporated into a vector and used for prodn. of The Quad in transformed host cells for use in DNA amplification reactions and esp. for radioactive sequenci reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1372

C; Comment: Anglotensin I is released from angiotensinogen by renin, which is secreted
e I (angiotensin-converting enzyme), primarily in the lungs.
C; Comment: The release of the amino-terminal residue (Asp-25) from angiotensin I and
sp-1]angiotensin I is converted to angiotensin III by dipeptidyl carboxypeptidase I.
